

Changing plugin Name

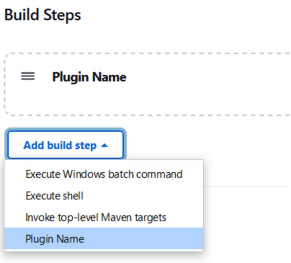

Tuesday, March 7, 2023 2:15 PM

In the Builder File (FileProcessingBuilder.java), here is what you can change:

- Display name for the Buildstep

```
67
68
69  @Override
70  public boolean isApplicable(Class<? extends AbstractProject> aClass) { return true; }
71
72  //display name for the Build step. will show up when adding plugin as a build step in the dashboard
73  @Override
74  public String getDisplayName() {
75      return "Plugin Name";
76      //return Messages.HelloWorldBuilder_DescriptorImpl_DisplayName();
77  }
78
79  }
80
81
82
```

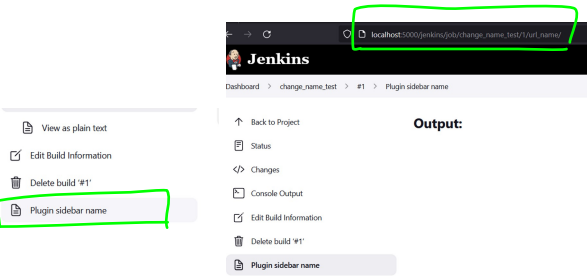

How it shows up in the Dashboard:

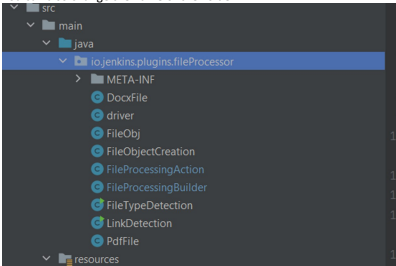

In the action File (FileProcessingAction.java):

- Side panel name
- Name for the build's URL fragment

```
28
29  @Override
30  public String getDisplayName() {
31      //This is the label used for the side panel item.
32      return "Plugin sidebar name";
33  }
34
35  4 usages
36  @Override
37  public String getUrlName() {
38      //This is the URL fragment used for this action.
39      return "url_name";
40  }
41
42
```

If you want
You can also change the name of the Folder:

But you also have to make sure to change the package name in each of the files so that they match:

```
FileTypeDetection.java x FileProcessingBuilder.java x config.jelly x index.jelly x pom.xml (file_detector) x PdfFile.java x FileProc
/*...*/
package io.jenkins.plugins.fileProcessor;
import ...
@OmrM
public class FileProcessingAction implements RunAction2 {
    3 usages
```
